

Amendment Decision Record — Replace Independent Auditor Gate with Computational Evidence Adjudication

Amendment ID: AMENDMENT-ADR-0003-COMPUTATIONAL-ADJUDICATION

Status: Accepted

Authority: Project Owner

Scope: ADR-0003 and its associated governance procedure

Effective: Immediately upon commit to the authoritative repository branch

1. Decision

The mandatory requirement for an independent human Scientific Auditor to manually resolve the methodological questions defined by ADR-0003 is replaced by a **pre-specified computational evidence-adjudication framework**.

The purpose of this amendment is to allow the project to proceed autonomously while preserving scientific reproducibility, provenance, auditability, and protection against silent methodological drift.

The computational framework, rather than an individual human reviewer, shall resolve the ADR-0003 methodological parameters using explicitly defined evidence, deterministic rules, quantitative analyses, and documented fallback procedures.

2. Computational adjudication principle

The pipeline shall:

1. acquire relevant evidence from approved public scientific databases and literature sources;
2. construct a non-exhaustive empirical evidence corpus;
3. preserve immutable, content-hashed corpus snapshots;
4. standardize and provenance-track records deterministically;
5. perform the predefined analyses required by ADR-0003;
6. derive or recommend the five ADR-0003 methodological decisions using the frozen adjudication rules;
7. record the evidence, calculations, parameters, and resulting decisions in machine-readable and human-readable artifacts;
8. proceed automatically when all required decision criteria are satisfied.

The pipeline must **not** silently alter an adjudication rule because a newly acquired dataset produces an inconvenient result.

3. Living corpus

The empirical corpus is explicitly permitted to be **living and periodically refreshed**.

Each refresh shall:

- create a new immutable corpus snapshot;
- record retrieval dates and source versions where available;
- preserve source provenance;
- calculate content hashes;
- record the parent snapshot;
- record additions, removals, corrections, and changed records;
- rerun corpus characterization and the ADR-0003 adjudication procedures.

Refreshing the corpus does **not** constitute a modification of ADR-0003.

ADR-0003 therefore defines the methodological decision procedure, while individual corpus snapshots represent the evidence available to that procedure at a particular point in time.

4. Deterministic decision rules

The implementation shall convert every ADR-0003 methodological decision into explicit, version-controlled, testable rules.

The implementation must not substitute developer judgment for an absent rule.

Where a rule produces a unique result, that result becomes the computationally adjudicated parameter for that corpus snapshot.

Where the evidence does not satisfy the predefined rule, the pipeline shall return:

GOVERNANCE_EXCEPTION — INSUFFICIENT OR OUT-OF-SCOPE EVIDENCE

and must not invent, guess, optimize, or silently modify the parameter.

5. Decision provenance

Every computational adjudication shall record:

- corpus snapshot identifier;
- corpus content hash;
- source provenance;
- software/environment version;
- rule-set version;
- input statistics;
- intermediate calculations;

- final parameter values;
- uncertainty/sensitivity information;
- adjudication status;
- timestamp.

The resulting record must be reproducible from the immutable corpus snapshot and the versioned adjudication rules.

6. Continuous operation

Following successful initialization, the pipeline may proceed without human intervention.

Periodic corpus refreshes are permitted throughout the lifetime of the project.

Routine evidence refreshes shall **not require amendment of ADR-0003**.

Only changes to the methodological rules themselves require a governance amendment.

7. Exception handling

If newly acquired evidence falls outside the predefined computational decision procedure, the pipeline shall stop only the affected adjudication-dependent operation and create a machine-readable governance exception report.

It shall not:

- silently change thresholds;
- silently change provenance requirements;
- silently change duplicate-resolution rules;
- silently change ATP Km policy;
- silently change train/evaluation rules;
- silently change corpus admissibility criteria.

The exception must identify the precise rule that failed and the evidence responsible.

8. Governance consequence

This amendment authorizes ADR-0003 to function as a **computationally adjudicated scientific methodology** rather than a manually adjudicated Auditor gate.

No independent human Auditor is required for routine execution of ADR-0003 once the computational adjudication framework has been implemented and validated.

This amendment does not authorize arbitrary scientific decisions by the implementation developer. All decisions must originate from the explicitly versioned rules and evidence-adjudication procedures established under ADR-0003.

9. Effective status

Upon acceptance and commit of this Amendment Decision Record, the repository's governance documents shall be updated to reflect this change.

ADR-0003 shall thereafter be implemented and evaluated according to the computational evidence-adjudication framework defined by this amendment.

Project Owner Decision: Accepted.
